

Disaster recovery is vital.

AltuGuard™ disaster recovery solutions feature near real-time backups and also include seamless off-site data storage and multi-year archiving capabilities – to get you back online fast.

Advanced restoration options like file and folder level restorations, Exchange message and mailbox recovery, as well as bare metal restorations to dissimilar hardware, will all help get you back up and running in the event of any type of catastrophe.

AltuGuard™ disaster recovery is a fully managed solution that provides you with a cost-effective way to bullet-proof your data.

This new NAS-based technology performs data backup at the block level where the actual 1's and 0's are captured from the hard drive, essentially eliminating failures related to open files. Block level data is raw data which does not have a file structure imposed on it.

Database applications such as Microsoft SQL Server and Microsoft Exchange Server transfer data in blocks without having to worry if files are open or being used. Block transfer is the most efficient way to write to disk. Backups are performed as frequent as every 15 minutes providing clients with an increased amount of restore points when compared to traditional tape backups.

With AltuGuard there is often no hardware to buy, no setup fees, and with our automatic services, no additional management required to oversee it all. Take the hassle and cost out of protecting your network with AltuGuard pay-as-you-go online services.

We can help you solve *any* IT problem. Give us a call today.
